PSYC214: Statistics
Lecture 2 – One factor between-participants ANOVA – Part I

Michaelmas Term,
Dr Richard Philpot
r.philpot@lancaster.ac.uk

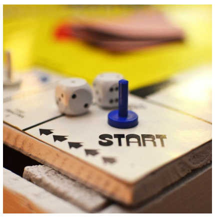
1

1

One factor between-participants ANOVA

Agenda/Content for Lecture 2

- Introduction to analysis of variance (ANOVA)
- Introduction to one factor between-participants design
- Sources of variability in data
- Calculating within-group and between-group variances
- Degrees of Freedom
- Producing the F-statistic



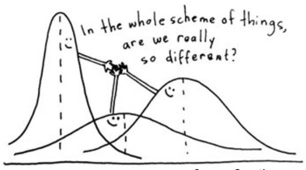
2

2

Introduction to analysis of variance

Why conduct an analysis of variance?

- Compares means and variance
- Allows analysis of group differences for more than two groups
- Several means without inflating Type I error rate



Source: Questionpro

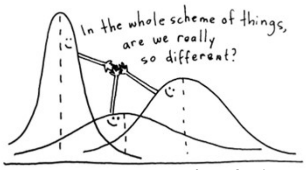
3

3

Introduction to analysis of variance

What do you need for a one factor between participants ANOVA?

- At least one categorical independent variable (i.e., one factor)
- One continuous dependent variable (outcome measure)



Source: Questionpro

4

4

Sources of variability in data

1. Treatment effects
2. Individual differences
3. Random (residual) errors

Within-group variability?

Between-group variability?

5

5

Sources of variability in data

1. Treatment effects
2. Individual differences
3. Random (residual) errors

6

6

Treatment effects

- The effects of the independent variable
- This is what we want!
- We want people who are treated differently because of our intervention to behave differently

7

7

Sources of variability in data

1. Treatment effects
2. Individual differences
3. Random (residual) errors

8

8

Individual differences

- Some individuals may be more proficient in memory recall
- Maybe some individuals have experience of similar tasks
- Some may have ignored instructions or had lower attention spans / motivation
- A control group can employ their own strategy, increasing the variability

9

9

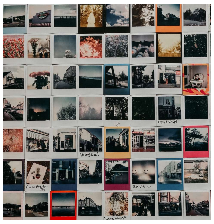
Sources of variability in data

1. Treatment effects
2. Individual differences
3. Random (residual) errors

10

Random (residual) errors

- Ideally a participant would have a ‘true level’ at which they perform, which can always be measured accurately
1. Varying external conditions – e.g., temperature, time of day
2. State of participant (e.g. tired?)
3. Experimenter’s ability to measure accurately…



11

…Experimenter effects

- Experimenters need to minimise these, so not to obscure the treatment effect
- Spread data away from the true means – i.e., increase variability and standard errors
- Reduce confidence in our estimates and a randomly plucked sample

12

Within- and between- group variability

- Within-group variability
  - The extent to which participants within a single group or population differ, despite receiving the same treatment
- Between-group variability
  - The extent to which overall groups differ from one another (hopefully because of our treatment)

Within-group variability?

Between-group variability?

13

13

Within- and between- group variability

High between-group variability - no within group-variability

	Group A	Group B	Group C
	10	20	30
	10	20	30
	10	20	30
	10	20	30
	10	20	30
Mean	10	20	30
S	0	0	0

No between-group variability - high within-group variability

	Group A	Group B	Group C
	10	15	5
	25	20	25
	30	30	25
	35	40	45
	50	45	50
Mean	30	30	30
S	14.6	12.8	18.0

Moderate between-group variability - moderate within-group variability

	Group A	Group B	Group C
	10	10	20
	10	20	20
	10	20	30
	20	20	30
	20	30	30
Mean	14	20	26
S	5.5	7.1	5.5

Tables adapted from Roberts and Russo (1999)

15

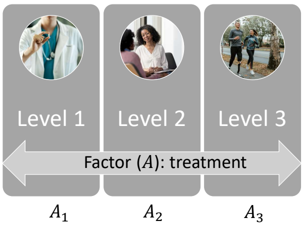
15

Introduction to analysis of variance

Lancaster University

Factors and levels

- Factor: treatment
- 3 levels
  - Medication
  - Counselling
  - Exercise



16

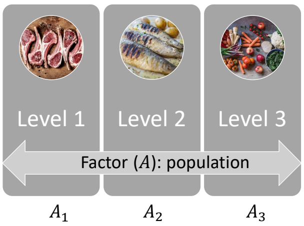
16

Introduction to analysis of variance

Lancaster University

Factors and levels

- Factor: population
- 3 levels:
  - A_1 Meat eater
  - A_2 Pescatarian
  - A_3 Vegetarian



17

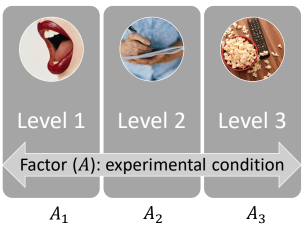
17

Introduction to analysis of variance

Lancaster University

Factors and levels

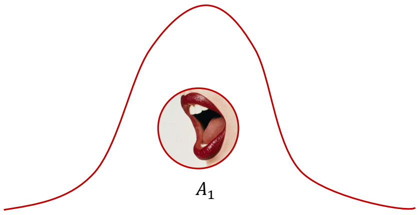
- Factor: experimental condition
- 3 levels:
  - A_1 Verbal negative feedback
  - A_2 Written negative feedback
  - A_3 Control (no feedback)



18

18

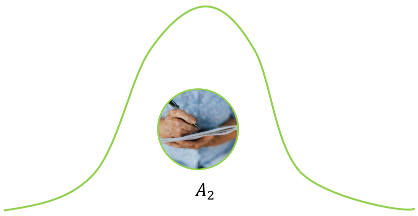
Introduction to analysis of variance



19

19

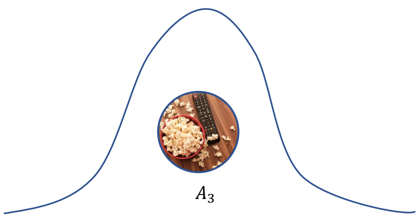
Introduction to analysis of variance



20

20

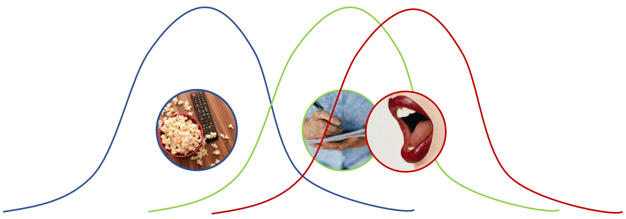
Introduction to analysis of variance



21

21

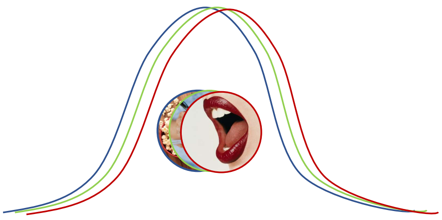
Introduction to analysis of variance



22

22

Introduction to analysis of variance



23

23

Testing for differences

- H_0 the Null Hypothesis
- Under H0, the samples come from the same population
- $\mu_1 = \mu_2 = \mu_3$ [No difference in the population means]
- Experimental effect = 0
- All differences are due to individual differences + random (residual) errors

- H_1 the Experimental Hypothesis
- Under H_1, the samples come from the different populations.
- $\mu_1 \neq \mu_2 \neq \mu_3$ [Population means are different]
- Experimental effect $\neq 0$
- All differences are due to individual differences, random (residual) errors AND the experimental effect

24

24

Introduction to analysis of variance

Lancaster University

$$F = \frac{\text{between-group variance}}{\text{within-group variance}}$$

$$F = \frac{\text{Signal}}{\text{Noise}}$$

$$F = \frac{\text{Signal}}{\text{Noise}}$$

25

25

The F ratio

Lancaster University

$$F = \frac{\text{between-group variance}}{\text{within-group variance}}$$

26

26

The F ratio

Lancaster University

$$F = \frac{\text{between-group variance}}{\text{within-group variance}}$$

$$F = \frac{\text{treatment effects} + \boxed{\text{individual differences + random (residual) errors}}}{\boxed{\text{individual differences + random (residual) errors}}}$$

experimental error

experimental error

27

27

The F ratio

Lancaster University

$$F = \frac{\text{between-group variance}}{\text{within-group variance}}$$

$$F = \frac{\text{treatment effects + individual differences + random (residual) errors}}{\text{individual differences + random (residual) errors}}$$

$$F = \frac{\text{treatment effects + experimental error}}{\text{experimental error}}$$

28

28

Introduction to analysis of variance

Lancaster University

$$F = \frac{\text{Signal}}{\text{Noise}}$$

$$F = \frac{\text{Signal}}{\text{Noise}}$$

The larger in magnitude the F value, the more treatment effects are standing out away from experimental error – i.e., the larger the signal is from the noise. The larger the F, the less likely that differences in scores are caused by chance.

39

39

Degrees of freedom

Lancaster University

Between-groups degrees of freedom

- The total number of levels minus one
- For example, in our experiment we have three levels [verbal feedback, written feedback, control]
- The between-groups degree of freedom is there 3 levels – 1 = 2
- Between-groups df = 2

40

40

Total between-group variance

Lancaster University

$$total\ between\ group\ variance = \frac{9(2.78 - 3.41)^2 + 9(3.11 - 3.41)^2 + 9(4.33 - 3.41)^2}{\boxed{2}}$$

N_{A1} = Number of scores for A_1 = 9

53

53

Degrees of freedom

Lancaster University

Within-groups degrees of freedom

- For within-groups degrees of freedom, we add up the number of participants for each level – 1
- Mathematically this is expressed as:

$= (N_{A1} - 1) + (N_{A2} - 1) + (N_{A3} - 1)$

$= (9 - 1) + (9 - 1) + (9 - 1)$

$\boxed{= 24}$

54

54

Total within-group variance

Lancaster University

$$total\ within\ group\ variance = \frac{\sum(A_1 - 2.75)^2 + (A_2 - 3.11)^2 + (A_3 - 4.33)^2}{24}$$

Lancaster University

The F ratio

Lancaster University

$$F = \frac{\text{between-group variance}}{\text{within-group variance}}$$

$$F = \frac{6.037}{1.769}$$

F = 3.414, p = 0.05, A statistically significant test result (P ≤ 0.05)

Lecture 2 – One factor between-participants ANOVA

Lancaster University

Review of lecture 2

- What is Analysis of Variance
- What is a one-factor between-participants design
- Sources of variability in data
- Calculated within-group and between-group variances
- Degrees of Freedom
- Produced the F-statistic

Lancaster University
